

ABSTRACT

METHOD OF, SYSTEM FOR, AND COMPUTER PROGRAM PRODUCT FOR PROVIDING AN E-BUSINESS CONNECTOR BUILDER

A transaction-based application is adapted to process transactions over a network such as an internet or intranet. The transaction-based application is adapted by scanning the source code of the transaction-based application to identify a transaction and information related to the transaction; storing the related information in a database; extracting from the database parameter definitions describing communication of information by the transaction; identifying a parameter usage type for each parameter, said parameter usage type selectable from the parameter usage type set comprising input, output, input/output, and unreferenced; displaying the transaction and a subset of the related and extracted information; allowing a user to select the transaction; and using the identified and extracted information to package the user-selected transaction in a form compatible with a connector building tool.
